line of
Piaware of our own Manufacture.
We offer these goods for sale at prices as low and liberal as can be found in any
market of our country.
A. O. KELLEY. W. A. KELLEY

CENTRAL HOTEL
We have already laid before our
readers accounts of the wonderful per-
formance of Professor Bell's telephone,
an instrument remarkable not merely
for its phenomenal capabilities but also
because of its having been brought to
its present stage of development within
the period which has elapsed since
June last. During that month, Pro-
fessor Bell exhibited the apparatus at
the Centennial, working it over short
distances only, and causing it to trans-
mit sound, which reached the opposite
terminus very much diminished in in-
tensity. Without undertaking to fol-
low the inventor through his various
improvements, it will suffice here to
state that the telephone has recently
carried the human voice over a dis-
tance of 143 miles (from Boston to
North Conway, N. H.), so that ordinary
conversations can be carried on with
ease and were distinctly audible at the
other. Further even than this, the in-
ventor and his assistant have talked
through a wire arranged to give an ar-
tificial resistance equal to 40,000 ohms,
which is more resistance than the en-
tire length of the Atlantic cable would
offer. There are, however, other ob-
stacles than the resistance, which checks
the transmission of the voice over
such immense distances. These the
inventor is now endeavoring to over-
come; and at the first favorable
opportunity, a practical test of the
powers of the instrument over one of
the transatlantic cables will be at-
tempted.
In the telephone which we illustrated
recently in the Scientific American
Supplement, a battery current was di-
rectly employed. The most important
improvement yet made in the apparatus
is the entire abolition of the battery
and electro-magnets, and the substitution
of the permanent magnet, the electric
current being generated by the voice
itself.
We understand that Professor Bell
has patents pending for some further
improvements in his apparatus. These
we shall notice at some future time.
We are indebted to a correspondent
for the sketches whence we have pre-
pared the engravings representing Pro-
fessor Bell lecturing on the telephone,
at Salem, Mass., on February 12 last,
and also the group in the inventor's
study, in Exeter place, Boston, receiv-
ing his communications during the
course of the lecture. The apparatus,
an exterior view of which is also given,
is all contained in an oblong box about
7 inches high and wide, and 12 inches
long. This is all there is visible of the
instrument, which during the lecture
is placed on a desk at the front of the
stage, with its mouthpiece toward the
audience. Not only was the conversa-
tion and singing of the people at the
Boston and distinctly audible in the
Salem hall, 14 miles away, but Pro-
fessor Bell's lecture was plainly heard
and applause sent over the wires by the
listeners in Boston.
Professor Bell was born in Edin-
burgh, Scotland, and came to this
country about six years ago. His
father, Professor A. M. Bell, who be-
came noted as the inventor of a method
for teaching deaf mutes to speak,
and of a universal system of phonography,
is now living in Brantford, Ontario.
Professor Graham Bell, the present in-
ventor, has also been exceptionally
successful in the instruction of deaf
mutes, and in one case he has enabled
a girl who had never produced an ar-
ticulate sound to pronounce words dis-
tinctly after having her under his
tutelage for the short space of two
months. "If I can make a deaf mute
talk," the now famous inventor is re-
ported to have said, "I can make iron
talk." We need not add that his
promise has been fulfilled. [Scientific
American.]
If we die to-day, the sun will shine
as brightly and the birds will sing as
sweetly to-morrow. Business will not
be suspended a moment, and the great
mass will not bestow a thought upon
our memories. "Is he dead?" will be
the solemn inquiry of a few, as they
pass to their work. But no one will
miss us except our immediate con-
nections, and in a short time they will
forget and laugh as merrily as when
we sat beside them. Thus shall we all,
no active in life pass away. Our
children crowd close behind us, and
they will soon be gone. In a few years
not a living being can say, "I remem-
ber him." We live in another age,
and did business with those who slum-
ber in the tomb. Thus is life! How
rapidly it passes!
On Monday last Mr. Philip Arnold
sheared his home flock of sheep, con-
sisting of 44 head, of which 39 are
yearlings. The imported Leicester
buck, (of which we have previously
made mention,) sheared 24 pounds.
The fleece is remarkable for length and
fineness of texture. A sample was
shown as which measured 21 inches in
length. This buck is but two years
old. Five head of two-year-old Leices-
ters yielded 96 pounds of wool—being
over sixteen pounds to the sheep. The
home flock of 44 sheep yielded a
clip of 619 pounds. Mr. Arnold has a
flock of 800 sheep on his farm, some
three miles from town, which will be
sheared during the coming week.

fessor Bell's lecture was plainly heard
and applause sent over the wires by the
listeners in Boston.
Professor Bell was born in Edin-
burgh, Scotland, and came to this
country about six years ago. His
father, Professor A. M. Bell, who be-
came noted as the inventor of a method
for teaching deaf mutes to speak,
and of a universal system of phonography,
is now living in Brantford, Ontario.
Professor Graham Bell, the present in-
ventor, has also been exceptionally
successful in the instruction of deaf
mutes, and in one case he has enabled
a girl who had never produced an ar-
ticulate sound to pronounce words dis-
tinctly after having her under his
tutelage for the short space of two
months. "If I can make a deaf mute
talk," the now famous inventor is re-
ported to have said, "I can make iron
talk." We need not add that his
promise has been fulfilled. [Scientific
American.]
If we die to-day, the sun will shine
as brightly and the birds will sing as
sweetly to-morrow. Business will not
be suspended a moment, and the great
mass will not bestow a thought upon
our memories. "Is he dead?" will be
the solemn inquiry of a few, as they
pass to their work. But no one will
miss us except our immediate con-
nections, and in a short time they will
forget and laugh as merrily as when
we sat beside them. Thus shall we all,
no active in life pass away. Our
children crowd close behind us, and
they will soon be gone. In a few years
not a living being can say, "I remem-
ber him." We live in another age,
and did business with those who slum-
ber in the tomb. Thus is life! How
rapidly it passes!
On Monday last Mr. Philip Arnold
sheared his home flock of sheep, con-
sisting of 44 head, of which 39 are
yearlings. The imported Leicester
buck, (of which we have previously
made mention,) sheared 24 pounds.
The fleece is remarkable for length and
fineness of texture. A sample was
shown as which measured 21 inches in
length. This buck is but two years
old. Five head of two-year-old Leices-
ters yielded 96 pounds of wool—being
over sixteen pounds to the sheep. The
home flock of 44 sheep yielded a
clip of 619 pounds. Mr. Arnold has a
flock of 800 sheep on his farm, some
three miles from town, which will be
sheared during the coming week.

THE HERALD.
Arrival and Departure of the
Mails.
The Western Mail leaves at 9 a. m.,
and arrives at 1 p. m.
The Eastern Mail leaves at 1 p. m.,
and arrives at 12 m.
Sulphur Springs, Fordville, Haynes-
ville and Pettitville leaves every Thursday
at 9 p. m., and arrives Saturday at 8 p. m.
Owensboro mail, via Peola, Bur-
ford, Pleasant Ridge and Masonville
leaves on Tuesday and Friday at 7 a. m.,
and arrives Monday and Thursday at 6
p. m.
Centerville mail arrives at 10 a.
m., and departs at 11 a. m. Wednesday.
C. J. LAWTON, Postmaster.

THE TELEPHONE.
We have already laid before our
readers accounts of the wonderful per-
formance of Professor Bell's telephone,
an instrument remarkable not merely
for its phenomenal capabilities but also
because of its having been brought to
its present stage of development within
the period which has elapsed since
June last. During that month, Pro-
fessor Bell exhibited the apparatus at
the Centennial, working it over short
distances only, and causing it to trans-
mit sound, which reached the opposite
terminus very much diminished in in-
tensity. Without undertaking to fol-
low the inventor through his various
improvements, it will suffice here to
state that the telephone has recently
carried the human voice over a dis-
tance of 143 miles (from Boston to
North Conway, N. H.), so that ordinary
conversations can be carried on with
ease and were distinctly audible at the
other. Further even than this, the in-
ventor and his assistant have talked
through a wire arranged to give an ar-
tificial resistance equal to 40,000 ohms,
which is more resistance than the en-
tire length of the Atlantic cable would
offer. There are, however, other ob-
stacles than the resistance, which checks
the transmission of the voice over
such immense distances. These the
inventor is now endeavoring to over-
come; and at the first favorable
opportunity, a practical test of the
powers of the instrument over one of
the transatlantic cables will be at-
tempted.
In the telephone which we illustrated
recently in the Scientific American
Supplement, a battery current was di-
rectly employed. The most important
improvement yet made in the apparatus
is the entire abolition of the battery
and electro-magnets, and the substitution
of the permanent magnet, the electric
current being generated by the voice
itself.
We understand that Professor Bell
has patents pending for some further
improvements in his apparatus. These
we shall notice at some future time.
We are indebted to a correspondent
for the sketches whence we have pre-
pared the engravings representing Pro-
fessor Bell lecturing on the telephone,
at Salem, Mass., on February 12 last,
and also the group in the inventor's
study, in Exeter place, Boston, receiv-
ing his communications during the
course of the lecture. The apparatus,
an exterior view of which is also given,
is all contained in an oblong box about
7 inches high and wide, and 12 inches
long. This is all there is visible of the
instrument, which during the lecture
is placed on a desk at the front of the
stage, with its mouthpiece toward the
audience. Not only was the conversa-
tion and singing of the people at the
Boston and distinctly audible in the
Salem hall, 14 miles away, but Pro-
fessor Bell's lecture was plainly heard
and applause sent over the wires by the
listeners in Boston.
Professor Bell was born in Edin-
burgh, Scotland, and came to this
country about six years ago. His
